

Management of Childhood Brain Tumors (Foundations of Neurological Surgery)

In children, the central nervous system tumors complicated through advances in the three main are exceeded in incidence only by leukemia and antineoplastic therapeutic modalities-surgery, are more common than any of the other malignant radiation therapy, and chemotherapy. Improvements of childhood. Childhood central nervous systems in neurosurgical technique concomitant system tumors encompass a range of histology with improvements in anesthesia and perioperative logic varieties from the histologically benign supportive care have resulted in decreased appearing pilocytic astrocytoma to the extremely morbidity and mortality from neurosurgical malignant-appearing glioblastoma multiforme procedures together with an increased likelihood of accomplishing a gross total resection of and the undifferentiated primitive neuroectodermal tumors. Similarly, the biologic behavior tumor. Radiotherapy has evolved from using orthovoltage (200-250 KV) equipment to of childhood brain tumors varies not only according to histology but also with location of supervoltage equipment with much-improved the tumor and age. Unlike primary central nervous system tumors in adults, many varieties of accurate homogeneous high doses to childhood brain tumors have the propensity to large volumes without significant effects on the disseminate via the cerebrospinal fluid path overlying skin and soft tissues. Preliminary data ways.
