Fibromyalgia is defined as a condition characterized by pain affecting the entire body, especially focusing on the muscles, bones, joints and tendons. This condition may be sometimes linked to arthritis, but since it doesn't cause actual inflammation of the joints or muscles only pain and discomfort - it is only considered a rheumatic condition. The pain caused by fibromyalgia is chronic and there is no absolute cure for this condition. Other common manifestations include fatigue, mood swings, depression, sleep deprivation etc. Fibromyalgia can affect both men and women of almost all ages and it affects the normal processing of pain signals by the brain. Fibromyalgia can cause a great deal of damage to the personal relationships of the sufferer, starting with the one they have with themselves. To some people, the idea that they will no longer live life as they did before can be devastating on many levels. It can affect the close relationships the person has and all this amplified by additional depression and anxiety. The feelings of pain and helplessness can be overwhelming for fibromyalgia patients and their families, friends, partner, co-workers and other close people. In these cases, support, understanding and patience is more than necessary. If someone you know has been diagnosed with this condition, the first thing to do is to inform yourself about it. After you do, offer them support and help with anything they need. This book will help you on your journey and provide help and advice all along the way, for both the victim, and those that care for the victim. Here Is A Preview Of What You'll Learn...
